### Aims

Iron deficiency (ID) is associated with adverse outcomes in heart failure (HF) but the underlying mechanisms are incompletely understood. Intracellular iron availability is secured by two mRNA-binding iron-regulatory proteins (IRPs), IRP1 and IRP2. We generated mice with a cardiomyocyte-targeted deletion of *Irp1* and *Irp2* to explore the functional implications of ID in the heart independent of systemic ID and anaemia.

### Methods and results

Iron content in cardiomyocytes was reduced in *Irp*-targeted mice. The animals were not anaemic and did not show a phenotype under baseline conditions. *Irp*-targeted mice, however, were unable to increase left ventricular (LV) systolic function in response to an acute dobutamine challenge. After myocardial infarction, *Irp*-targeted mice developed more severe LV dysfunction with increased HF mortality. Mechanistically, the activity of the iron-sulphur cluster-containing complex I of the mitochondrial electron transport chain was reduced in left ventricles from *Irp*-targeted mice. As demonstrated by extracellular flux analysis *in vitro*, mitochondrial respiration was preserved at baseline but failed to increase in response to dobutamine in *Irp*-targeted cardiomyocytes. As shown by <sup>31</sup>P-magnetic resonance spectroscopy *in vivo*, LV phosphocreatine/ATP ratio declined during dobutamine stress in *Irp*-targeted mice but remained stable in control mice. Intravenous injection of ferric carboxymaltose replenished cardiac iron stores, restored mitochondrial respiratory capacity and inotropic reserve, and attenuated adverse remodelling after myocardial infarction in *Irp*-targeted mice but not in control mice. As shown by electrophoretic mobility shift assays, IRP activity was significantly reduced in LV tissue samples from patients with advanced HF and reduced LV tissue iron content.

### Conclusions

ID in cardiomyocytes impairs mitochondrial respiration and adaptation to acute and chronic increases in workload. Iron supplementation restores cardiac energy reserve and function in iron-deficient hearts.

### Keywords

Iron deficiency • Heart failure • Energy metabolism • Extracellular flux analysis • <sup>31</sup>P-Magnetic resonance spectroscopy

Reading: Are Scientific Data Repositories Coping with Research Data Publishing? Share: [f](#) [t](#) [g+](#) [in](#) [Download](#)

Table 1 gives some basic data on the selected repositories including their type, year of foundation, base location, underlying software, and whether the repository is certified or not<sup>8</sup>. Being generalist, these repositories do not have a specific designated community (CCSDS, 2012). In fact, the communities that use each repository are quite diverse each other, e.g., Figshare and Zenodo datasets are less discipline focused than CSIRO ones (cf. Tab. 4). This heterogeneity is not expected to impact on the criteria we based our investigation because of the discipline-agnostic nature of the proposed criteria.

<b>Aims</b>	Iron deficiency (ID) is associated with adverse outcomes in heart failure (HF) but the underlying mechanisms are incompletely understood. Intracellular iron availability is secured by two mRNA-binding iron-regulatory proteins (IRP), IRP1 and IRP2. We generated mice with a cardiomyocyte-targeted deletion of Irp1 and Irp2 to explore the functional implications of ID in the heart independent of systemic ID and anaemia.
<b>Methods and results</b>	Iron content in cardiomyocytes was reduced in Irp-targeted mice. The animals were not anaemic and did not show a phenotype under baseline conditions. Irp-targeted mice, however, were unable to increase left ventricular (LV) systolic function in response to an acute dobutamine challenge. After myocardial infarction, Irp-targeted mice developed more severe LV dysfunction with increased HF mortality. Mechanistically, the activity of the iron-sulphur cluster-containing complex I of the mitochondrial electron transport chain was reduced in left ventricles from Irp-targeted mice. As demonstrated by noninvasive flux analysis in vivo, mitochondrial respiration was preserved at baseline but failed to increase in response to dobutamine in Irp-targeted cardiomyocytes. As shown by <sup>31</sup> P-magnetic resonance spectroscopy in vivo, LV phosphocreatine/ATP ratio declined during dobutamine stress in Irp-targeted mice but remained stable in control mice. Intravenous injection of ferric carboxymaltose replenished cardiac iron stores, restored mitochondrial respiratory capacity and isotropic reserve, and attenuated adverse remodelling after myocardial infarction in Irp-targeted mice but not in control mice. As shown by electrophoretic mobility shift assays, IRP activity was significantly reduced in LV tissue samples from patients with advanced HF and reduced LV tissue iron content.
<b>Conclusions</b>	ID in cardiomyocytes impairs mitochondrial respiration and adaptation to acute and chronic increases in workload. Iron supplementation restores cardiac energy reserve and function in iron-deficient hearts.
<b>Keywords</b>	Iron deficiency • Heart failure • Energy metabolism • Extracellular flux analysis • <sup>31</sup> P-Magnetic resonance spectroscopy

Cellular Generation and Phenotyping

👤 Hazel Rogers

Steps Abstract Guidelines Warnings Materials Metadata Metrics

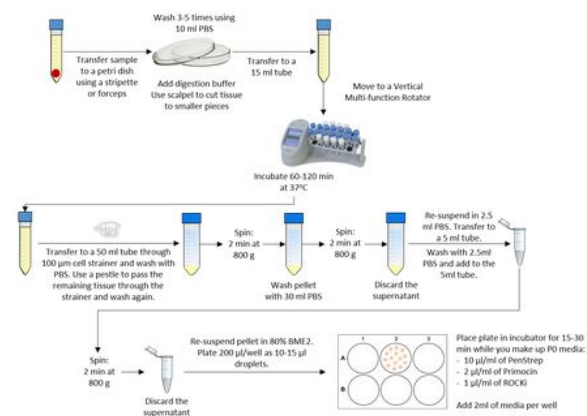

### BEFORE STARTING

- Thaw BME2 aliquot overnight at  $\delta$  4 °C and dilute 4:1 with appropriate organoid media (tissue specific) to make an 80% stock
- Ensure cell culture plates have been stored overnight in  $\delta$  37 °C incubator
- Pre-warm organoid culture media to room temperature
- Prepare 100 mg/ml collagenase stock. Re-suspend 1 g collagenase II in 10 mL PBS. Aliquots can be stored at  $\delta$  -20 °C for up to one year.
- Prepare digestion buffer:

Reagent	Stock Concentration	Volume
Organoid Media	-	9.5 ml
Collagenase	100 mg/ml	0.5 ml
Primocin	50 mg/ml	0.02 ml
Penicillin Streptomycin	100X	0.1 ml
Rock inhibitor (Y-27632) (10 mM)	10 mM	0.01 ml

Process **5**

Data **8**

Material **12**

Method **1**

Aims **Iron deficiency (ID)** is associated with adverse outcomes in **heart failure (HF)** but the underlying mechanisms are incompletely understood. **Intracellular iron availability** is secured by **two mRNA-binding iron-regulatory proteins (IRPs), IRP1 and IRP2**. We generated mice with a cardiomyocyte-targeted deletion of *Irp1* and *Irp2* to explore the **functional implications** of ID in the **heart** independent of systemic ID and anaemia.

Methods and results Iron content in cardiomyocytes was reduced in **Irp-targeted mice**. The **animals** were not anaemic and did not show a phenotype under **baseline conditions**. *Irp*-targeted mice, however, were unable to increase **left ventricular (LV) systolic function** in response to an **acute dobutamine challenge**. After myocardial infarction, *Irp*-targeted mice developed more severe LV dysfunction with increased HF mortality.

Mechanistically, the activity of the **iron-sulphur cluster-containing complex I of the mitochondrial electron transport chain** was reduced in **left ventricles** from *Irp*-targeted mice. As demonstrated by extracellular flux analysis in vitro, mitochondrial respiration was preserved at baseline but failed to increase in response to **dobutamine in *Irp*-targeted cardiomyocytes**. As shown by **<sup>31</sup>P-magnetic resonance spectroscopy** in vivo, **LV phosphocreatine/ATP ratio** declined during dobutamine stress in *Irp*-targeted mice but remained stable in **control mice**. Intravenous injection of **ferric carboxymaltose** replenished **cardiac iron stores**, restored **mitochondrial respiratory capacity** and inotropic reserve, and attenuated adverse remodelling after myocardial infarction in *Irp*-targeted mice but not in control mice. As shown by **electrophoretic mobility shift assays**, IRP activity was significantly reduced in **LV tissue samples** from patients with advanced HF and **reduced LV tissue iron content**.

Conclusions ID in cardiomyocytes impairs mitochondrial respiration and adaptation to **acute and chronic increases** in workload. Iron supplementation restores **cardiac energy reserve** and function in **iron-deficient hearts**.

 Certainty 0.23

### Abstract

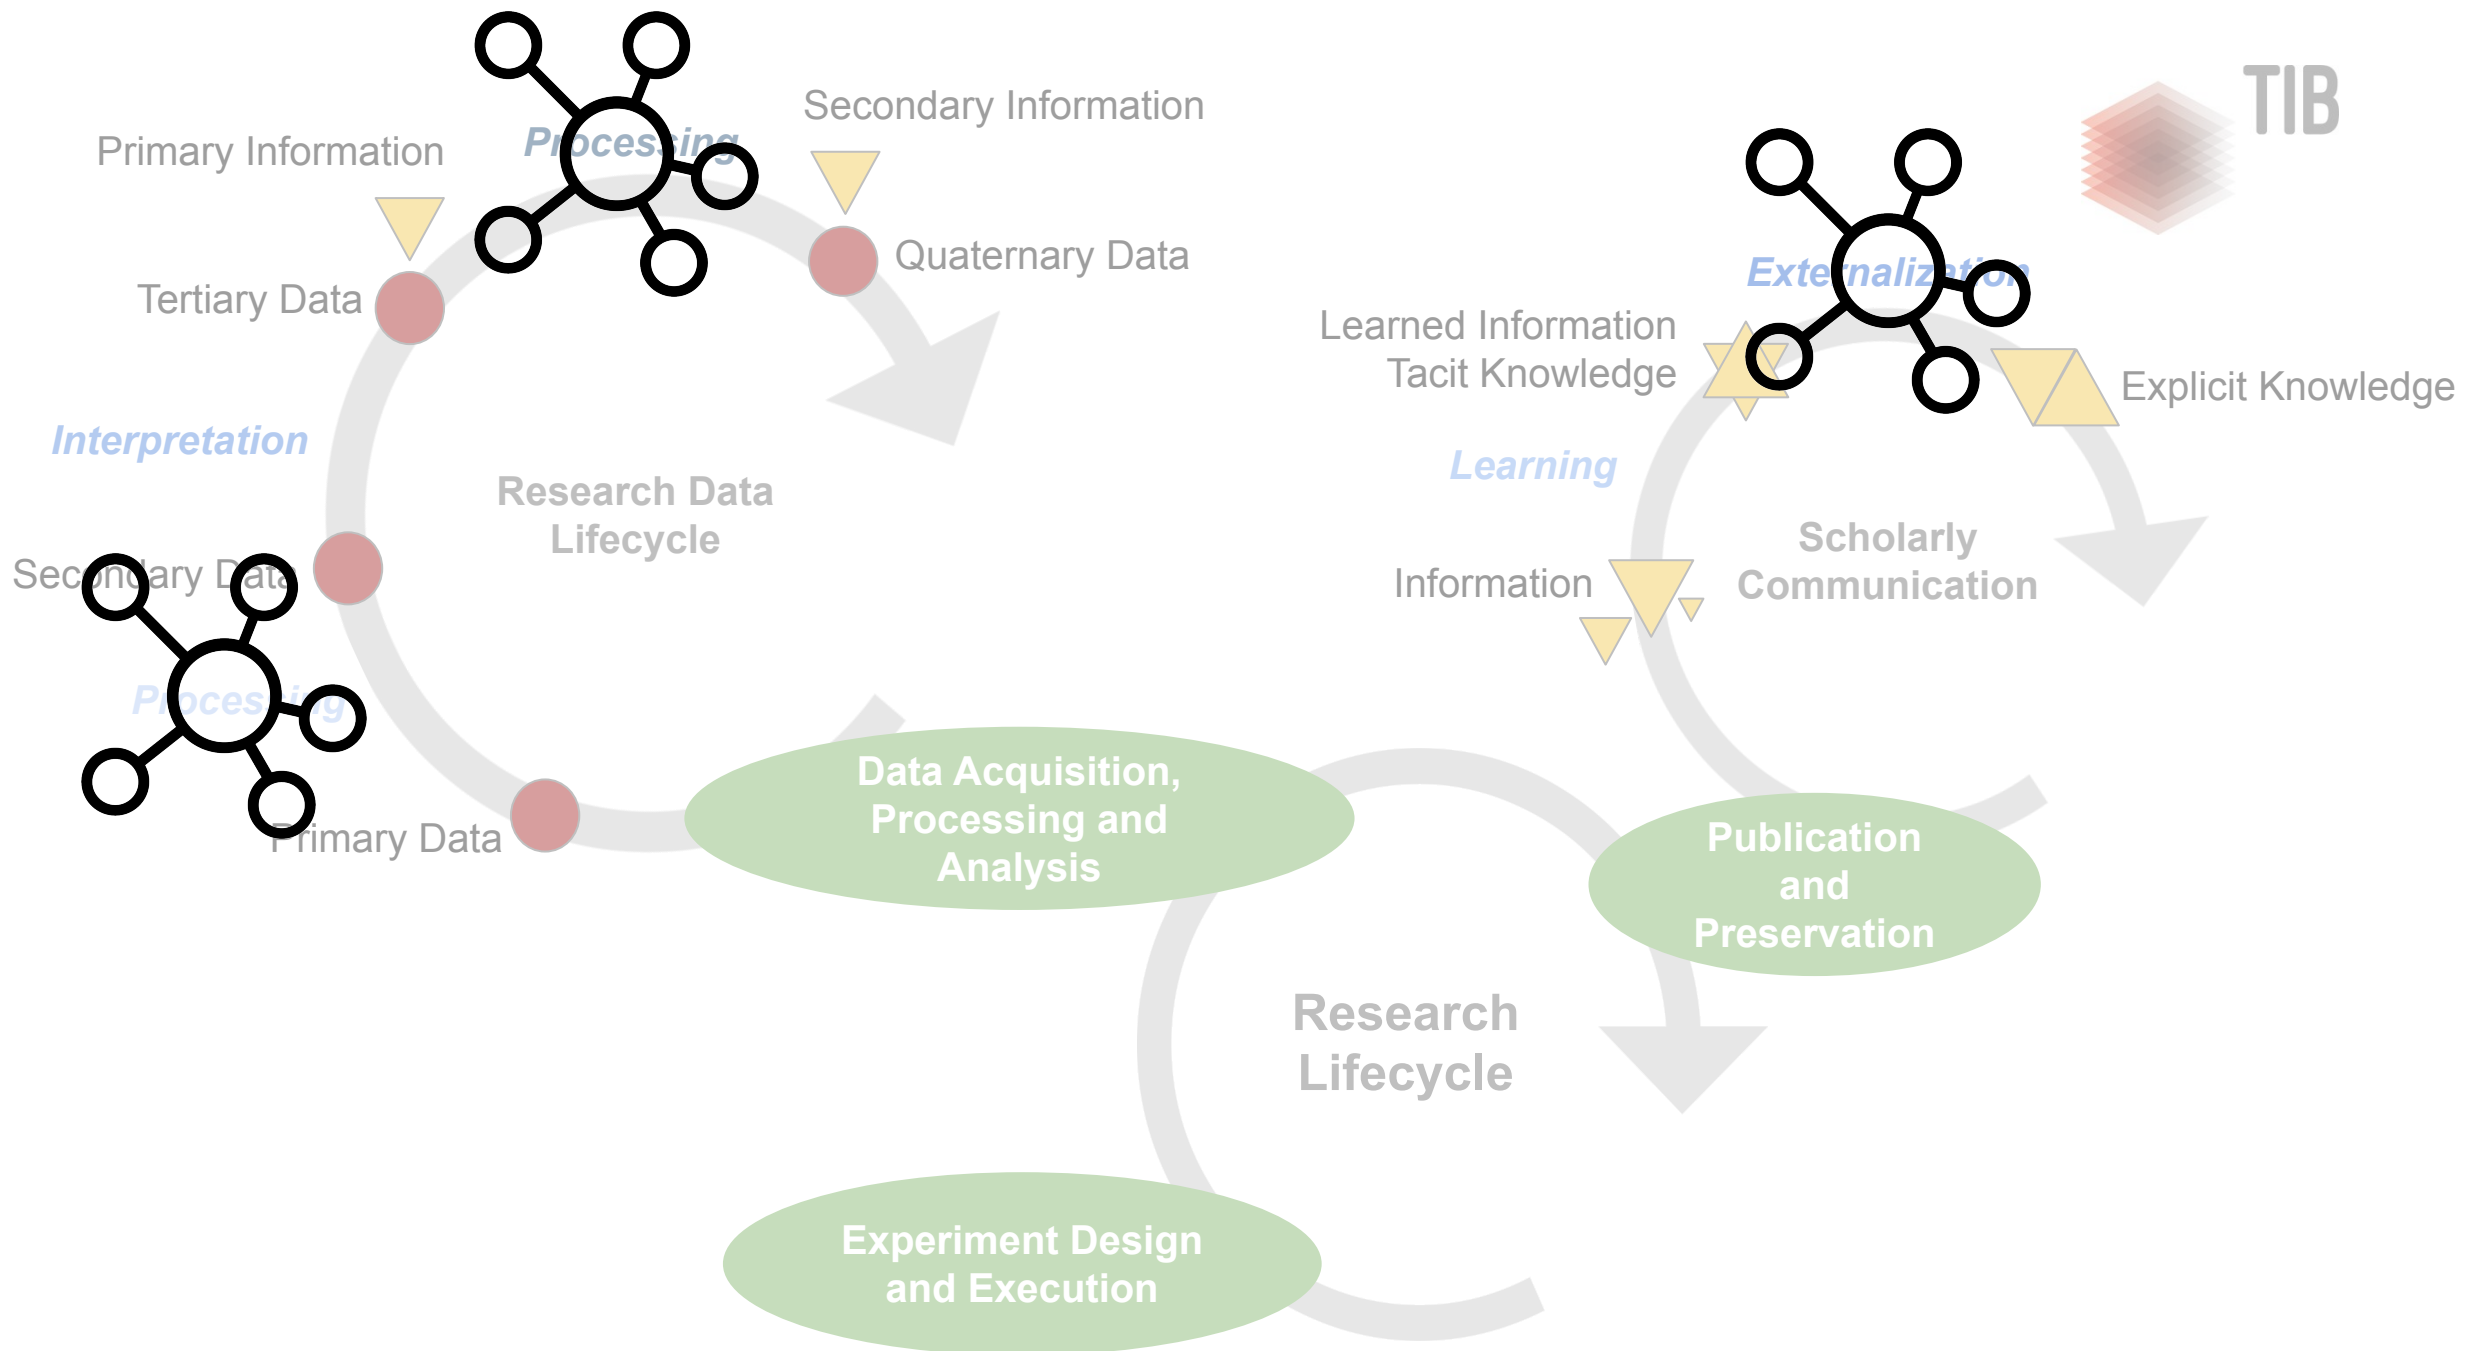

Computational Biology needs computer-readable information records. Increasingly, meta-analysed and pre-digested information is being used in the follow up of high throughput experiments and other investigations that yield massive data sets. Semantic enrichment of plain text is crucial for computer aided analysis. In general people will think about semantic tagging as just another form of text mining, and that term has quite a negative connotation in the minds of some biologists who have been disappointed by classical approaches of text mining. Efforts so far have tried to develop tools and technologies that retrospectively extract the correct information from text, which is usually full of ambiguities. Although remarkable results have been obtained in experimental circumstances, the wide spread use of information mining tools is lagging behind earlier expectations. This commentary proposes to make semantic tagging a more prominent part of the bioinformatics pipeline.

### Text mining? .....Why bury it first and then mine it again?

Recently, Sir Tim Berners-Lee, the inventor of the Web, said: 'Life sciences are particularly suitable for pioneering the use of information technology. In the past, for discovery, many databases and information systems used by drug researchers are already in, or are ready to be transformed to, machine-readable formats' [1].

*[Submitted on 20 Mar 2020]*

## The early phase of the COVID-19 outbreak in Lombardy, Italy

Cereda D, Tirani M, Rovida F, Demicheli V, Ajelli M, Poletti P, Trentini F, Guzzetta G, Marziano V, Barone A, Magoni M, Deandrea S, Diurno G, Lombardo M, Faccini M, Pan A, Bruno R, Pariani E, Grasselli G, Piatti A, Gramegna M, Baldanti F, Melegaro A, Merler S

In the night of February 20, 2020, the first case of novel coronavirus disease (COVID-19) was confirmed in the Lombardy Region, Italy. In the week that followed, Lombardy experienced a very rapid increase in the number of cases. We analyzed the first 5,830 laboratory-confirmed cases to provide the first epidemiological characterization of a COVID-19 outbreak in a Western Country. Epidemiological data were collected through standardized interviews of confirmed cases and their close contacts. We collected demographic backgrounds, dates of symptom onset, clinical features, respiratory tract specimen results, hospitalization, contact tracing. We provide estimates of the reproduction number and serial interval. The epidemic in Italy started much earlier than February 20, 2020. At the time of detection of the first COVID-19 case, the epidemic had already spread in most municipalities of Southern-Lombardy. The median age for of cases is 69 years (range, 1 month to 101 years). 47% of positive subjects were hospitalized. Among these, 18% required intensive care. The mean serial interval is estimated to be 6.6 days (95% CI, 0.7 to 19). We estimate the basic reproduction number at 3.1 (95% CI, 2.9 to 3.2). We estimated a decreasing trend in the net reproduction number starting around February 20, 2020. We did not observe significantly different viral loads in nasal swabs between symptomatic and asymptomatic. The transmission potential of COVID-19 is very high and the number of critical cases may become largely unsustainable for the healthcare system in a very short-time horizon. We observed a slight decrease of the reproduction number, possibly connected with an increased population awareness and early effect of interventions. Aggressive containment strategies are required to control COVID-19 spread and catastrophic outcomes for the healthcare system.

## Results

The epidemic in Italy started much earlier than February 20, 2020. At the time of detection of the first COVID-19 case, the epidemic had already spread in most municipalities of Southern-Lombardy. The median age for of cases is 69 years (range, 1 month to 101 years). 47% of positive subjects were hospitalized. Among these, 18% required intensive care. The mean serial interval is estimated to be 6.6 days (95% CI, 0.7 to 19). We estimate the basic reproduction number at 3.1 (95% CI, 2.9 to 3.2). We estimated a decreasing trend in the net reproduction number starting around February 20, 2020. We did not observe significantly different viral loads in nasal swabs between symptomatic and asymptomatic.

Here we provide an analysis of the first 5,830 laboratory-confirmed cases reported in Lombardy, with date of symptoms onset over the period from January 14 to March 8, 2020. Epidemiological analyses of the confirmed cases and their background demographic and exposure characteristics are presented here as well as the transmission dynamics of the infection within the Region. Also, the virological analysis on a subsample of the reported cases is included to provide preliminary assessment of the level of the viral load among symptomatic and asymptomatic cases.

## Take aways

- Scholarly work can be realized as expressions other than an article
- Content can also be realized so that it is more machine actionable
- Thus easier to reuse, for machines and people
- Turning the vision and prototypes into reality at scale is very challenging
- Advance scholarly communication from digitization to digitalization
- In addition to PDF publish essential scholarly knowledge also in structured form
- Requires a significant rethinking and rewiring of the current approaches and infrastructure
